

Multiport and Diverter valves

Habonim's C61 Multiport and DC47 diverter cryogenic lines are extremely flexible and space saving valves.

They enable the piping and machine designer to save valves, space, flow elements, while enhancing safety and simplicity.

With a variety of flow patterns and directions, in both automatic and manual configurations, the multiport valve can save 2-3 valves, and facilitate safe and easy changeover and shutoff of cryogenic fluids.

A variety of ball configurations for different flow patterns are available. For the complete range of configurations, please refer to the Diverter or Multiport valve chapters.
